

Quick Scene Guide

Unity® - Editor Tool (version 2.1)

Course Interactive – Oliver Ziegler

General Information

The Quick Scene Guide displays all scenes that are included in the current Build Settings as buttons that open the respective scenes. It also gives you the option to sort these scenes into chapters in order to display them in a more convenient overview. Settings, filters and favorites help to speed up the process of finding the scene your looking for.

This tool increses your efficiency in the day-to-day work on small and big projects.

You open the tool in the menu at Tools → Course → Quick Scene Guide

Standard Functionality

The standard functionality of the QSG is pretty much straight forward. A click on the button of a displayed scene opens this scene. The currently loaded scene is tagged with green color.

If you don't find your scene (or any scene at all) in the overview, it is not included in the current Build Settings. To change that, open the BuildSettings via File → BuildSettings an drag and drop your scene into the displayed list.

Favorites

Besides every button for opening a respective scene there is a button that displays a star. These buttons tag the respective scene as one of your favorites. If you activate the „Show only favorites“-Option in the „Extended Functions“-Menu, only these scenes will be listed in your overview. On this favorite-list normal filter options are still working. So you can, for example, also display all scenes with a special text in their name that are also tagged as favorites.

Change the build settings (LEFT CTRL)

The color of the scene buttons indicates if a scene is enabled or disabled in the build settings. You can change this state in this tool.

Press the **left CTRL-Key** and click on the scene button in any list of the tool to toggle it on or off.

Extended Functionality

At the bottom of the tool you can choose additional functions.

All Scenes

Displays all scenes registered in the build settings in a list. (Some will maybe be hidden because of the specific settings.)

Chapter

Displays the scenes according to their connection to a chapter. These chapters need to be defined and connected to scenes in the settings menu of this tool. (see Chapter display)

Filter

You can search for a specific scene in your build settings with a text based filter. Only scenes with the given text in their name or path are displayed in the list.

Settings

The settings of the tool are separated into three sections the last two of which are only of interest if you want to use the chapters feature.

Please save changes of the tools settings with the SAVE-Button!

Display Settings

The following settings define which scenes are displayed in the respective lists and allow for additional features to be shown. A short description of the single settings:

Name	Beschreibung
Show Only Favorites	When „All Scenes“ is selected only the scenes which are flagged als favorites will be displayed. Helpful to switch between otherwise unrelated scenes in a short time.
Hide inactive Scenes	Scenes which are deactivated in the build settings will not be displayed in the tools scene list.
Show path	Instead of showing only the scenes name on the button ist whole path will be shown.
List chapters horizontal	The chapters are normally displayed as foldouts in a vertical list. With this feature activated the chapters are displayed in column with all there scenes below them in a vertical list.
Show Copy Scene Button	In the row of the scene button an additional „copy“-button will appear. This button copys the scenes name in order to paste it into a game mechanic or script.
Show first scene on top	Is this options activated the first scene (scene 0) will always be displayed on top of the scene list (All Scenes) no matter how far you scrolled into the list.

Chapter display

Chapter Definition

In order to list your scenes in chapters you have to define them in **Settings > Chapter Definition**. Add a new entry to the list and give it the desired name.

The connection between scenes and chapters will be established in the menu „Chapter Content“.

Chapter Content

There are two ways to assign scenes and chapters. The easiest way is „by Scenes“.

By Scenes

In this menu all scenes registered in the build settings are listed vertically. On their right a button or drop down menu is displayed in order to select the wanted chapter.

The button which appears if a scene isn't assigned to a chapter works like follows:
Above the list you can choose a default chapter. When you click on the button „ADD TO DEFAULT“ behind a scene name this scene will be assigned to the selected default chapter.

With this process you can assign a lot of unassigned scenes rather fast to these chapters. You can change the assignment with the drop down menu of course.

Dont forget to save changes in the settings with the save button!

By Chapter

The second way to assign scenes and chapters is from the chapters point of view. Just select „By Chapter“ in this menu.

You need to open the foldout of the chapter you want to edit. With „Add scene“ and the X-Button behind every row you can add or delete scenes from this chapter. The drop down menu enables you to change the content directly.

With the up and down arrows you can change the order of the scenes inside the chapter. This will not change their order in the build settings but in the displayed lists of this tool.

A scene assigned with this method can appear in more than one chapter.

Dont forget to save changes in the settings with the save button!
